## Abstracts

According to our (Global Info Research) latest study, the global Oxide TFT Displays market size was valued at US\$ 8306 million in 2025 and is forecast to a readjusted size of US\$ 9971 million by 2032 with a CAGR of 2.6% during review period.

Oxide TFT Displays are display panels or display modules using oxide semiconductor thin-film transistors as the active-matrix backplane. The oxide semiconductor layer is used as the active channel material of the thin-film transistor, with representative technology routes including IGZO, metal oxide TFT, high-mobility oxide and related oxide backplane technologies. The product is not a separate light-emitting technology; instead, it is a backplane platform that can be combined with liquid crystal displays, organic light-emitting displays, electronic paper and micro light-emitting displays. Compared with conventional amorphous silicon backplanes, oxide thin-film transistors generally offer lower leakage current, higher electron mobility, lower power consumption and better suitability for high-resolution, large-size and variable-refresh-rate displays. Sharp defines IGZO as an oxide semiconductor composed of indium, gallium, zinc and oxygen and used as the semiconductor material for display-driving thin-film transistors, while Samsung Display states that oxide thin-film transistors have much higher electron mobility than amorphous silicon and are suitable for higher-resolution displays.

In 2025, global Oxide TFT Displays production reached approximately 178 million units, with an average global market price of around US\$ 45 per unit

The upstream materials of Oxide TFT Displays mainly include glass substrates, oxide semiconductor sputtering targets, gate/electrode metals, transparent conductive films, liquid crystal materials or organic light-emitting materials, color filter materials,

polarizers, backlight units, driver ICs, flexible printed circuits and encapsulation or bonding materials. Major upstream suppliers include Corning and AGC, Merck, etc.

By application, Oxide TFT Displays are mainly used in TV and Large Home Displays, IT Displays, Automotive Displays, and Others. The major downstream customers including Samsung Electronics, LG Electronics, Sony, Hisense, TCL Electronics, Xiaomi, etc.

The gross margin of Oxide TFT Displays is typically 8%~30%.

By product type, Oxide TFT Displays are segmented into Small-size Oxide TFT Displays, Below 7 inches; Medium-size Oxide TFT Displays, 7~20 inches; and Large-size Oxide TFT Displays, Above 20 inches. Small-size Oxide TFT Displays, Below 7 inches, are mainly used in smart devices, wearable devices, compact industrial terminals and portable equipment, where low power consumption, slim form factor and high pixel density are key requirements. Medium-size Oxide TFT Displays, 7~20 inches, are mainly used in tablets, notebook computers, automotive center displays, industrial control panels and medical terminals, with value concentrated in high resolution, low standby power, flexible refresh-rate control and improved reliability. Large-size Oxide TFT Displays, Above 20 inches, are mainly used in TVs, large monitors, professional displays and large home displays, where large-area uniformity, high-generation fab compatibility, high resolution and power efficiency are critical product advantages.

By application, Oxide TFT Displays are mainly used in TV and Large Home Displays, IT Displays, Automotive Displays and Others. TV and Large Home Displays require larger screen sizes, higher resolution, lower power consumption and stable image quality, and oxide semiconductor backplanes can improve panel driving capability and large-area display uniformity. IT Displays represent a major growth area, as notebook computers, tablets, monitors and professional office displays increasingly require lower power consumption, high resolution, variable refresh rate and thinner designs. Automotive Displays require wide operating temperature, long service life, low leakage current, high reliability and multi-display cockpit compatibility, making this a key application for mid-to-high-end oxide display products.

Market growth is mainly driven by rising demand for low-power and high-resolution premium displays, increasing adoption of variable-refresh-rate and long-battery-life panels in notebook computers, tablets and professional monitors, the upgrade of TV and Large Home Displays toward larger size and higher definition, the expansion of multi-screen and large-screen smart cockpits in Automotive Displays, and the growing use of stable low-leakage backplanes in industrial, medical, ePaper and near-eye

display applications. Additional momentum comes from panel makers upgrading high-generation production lines toward higher-value products, improving oxide semiconductor materials and process maturity, and terminal brands seeking differentiated display performance.

Market restraints mainly include higher process complexity, strict requirements for material purity, film uniformity, process control and yield management, and higher manufacturing costs in some applications compared with mature amorphous silicon backplanes. Profitability may also be affected by price cycles in large-size display panels. Competing technologies such as OLED, LTPS, LTPO and Micro LED can create substitution pressure in specific applications. Automotive, medical and industrial displays require long qualification cycles, which may slow customer adoption. In addition, the stability of oxide semiconductor material supply, sputtering target quality, equipment investment intensity and patent barriers can also influence capacity expansion and market penetration.
