Abstracts

The global Oxidized Pellet market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Oxidized pellets are an important method for agglomerating fines in the iron ore industry. This process involves mixing the fines with a suitable amount of water and binder to form green pellets with a uniform viscosity and sufficient strength. The green pellets are then dried and preheated before undergoing roasting in an oxidizing atmosphere. This roasting process helps the green pellets consolidate and transform into hardened pellets, known as oxidized pellets.

This method is particularly suitable for processing fine concentrates. Oxidized pellets exhibit good cold strength, reducibility, and particle size distribution. In the steel industry, oxidized pellets, along with sintered ore, are important feed materials for blast furnaces, forming a desirable burden structure. They are also used in non-ferrous metal smelting processes.

Overall, the process of agglomerating fines into oxidized pellets offers advantages in terms of improving the handling and utilization of fine ores in iron and steel production, as well as in the smelting of non-ferrous metals.

This report studies the global Oxidized Pellet production, demand, key manufacturers, and key regions.
