## Abstracts

According to our (Global Info Research) latest study, the global Oxygen Cone market size was valued at US\$ 238 million in 2025 and is forecast to a readjusted size of US\$ 381 million by 2032 with a CAGR of 6.9% during review period.

In 2025, global sales of oxygen cones reached 34,000 units, with an average selling price of US\$6,800 per unit. An oxygen cone is a device used for oxygen generation and distribution, primarily used in oxygen compressors and pipelines, and commonly found in the medical, industrial, and metallurgical industries. It ensures a stable oxygen supply by regulating the flow and pressure of oxygen, and is widely used in oxygen therapy in hospitals, oxygen-assisted combustion in steel manufacturing, and other industrial fields requiring high-purity oxygen. Oxygen cones are generally made of stainless steel, aluminum alloy, or copper alloy, possessing properties such as high pressure resistance, corrosion resistance, and oxidation resistance. The global total production capacity is approximately 42,000 units per year, with an average industry gross margin of about 27%. Upstream raw materials mainly include stainless steel, aluminum alloy, copper, and related electronic components, with stainless steel being the most significant material consumption component. Downstream suppliers primarily include medical equipment companies, steel smelters, petrochemical plants, and gas companies. With accelerated industrialization, increasing medical demand, and environmental policies driving oxygen technology upgrades, the oxygen cone market continues to expand. The future lies in the research and development of high-efficiency, low-energy-consumption equipment, as well as the integration of intelligent monitoring systems. Business opportunities mainly come from new energy, industrial automation, and the growth in global healthcare demand.

The oxygen cone market is a typical sub-sector of industrial gas supply, with demand

highly correlated with the development of steel smelting, non-ferrous metal processing, glass manufacturing, and some high-temperature combustion processes. In metallurgical systems, the oxygen cone, as a key component for oxygen injection and flow shaping, directly affects combustion efficiency and smelting results. Therefore, it requires high levels of heat resistance, oxidation resistance, and structural stability under high-temperature and high-corrosion conditions. With increasing demands for energy conservation, emission reduction, and refined control, downstream enterprises are setting higher standards for oxygen injection efficiency and oxygen utilization, driving product upgrades towards high-temperature resistant alloy materials, optimized structural designs, and longer service lives.

From an industry competitive perspective, the technological threshold for this product is not extremely high, but there are certain barriers in material selection and processing precision, especially in large steel mills and high-end industrial furnaces, where there is a preference for long-term cooperation with stable suppliers. The overall market size is not large, but it has strong rigid demand characteristics, belonging to equipment consumables with a certain replacement cycle and repurchase attributes. Future growth will mainly come from the upgrading of steel production capacity in developing countries and the promotion of high-efficiency and energy-saving combustion technologies. Simultaneously, driven by environmental policies, optimizing combustion efficiency to reduce emissions will also be a demand-driving factor. Overall, the oxygen cone market is growing at a steady pace, without explosive growth, but it has a solid foundation for long-term stable development due to its essential industrial demand and potential for technological upgrades.
