Abstracts

According to our (Global Info Research) latest study, the global Oxygen Plasma Degumming Machine market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Oxygen plasma degumming machine typically use capacitively coupled plasma parallel plate reactors. In the parallel electrode reactor, the reactive ion etching chamber adopts an asymmetric design with a small cathode area and a large anode area, and the etched objects are placed on the electrodes with a small area. Under the action of thermal motion generated by radio frequency power supply, negatively charged free electrons reach the cathode due to their small mass and fast moving speed. Positive ions cannot reach the cathode at the same time due to their large mass and slow speed, thus forming a negatively charged sheath near the cathode. Accelerated by the sheath, positive ions bombard the surface of the silicon wafer vertically to promote chemical reactions on the surface and separation of reaction products, resulting in a high etch rate. The ion bombardment of plasma strippers also enables anisotropic etching to achieve the same principles of plasma strippers and plasma etching. The difference lies in the type of reactive gas and the method of excitation of the plasma.
