Abstracts

The global Oxygen Transmission Rate Test System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

An Oxygen Transmission Rate Test System (OTR test system) is a specialized equipment used to measure the permeability of packaging materials and containers to oxygen gas. This testing process provides valuable information about the barrier properties of the packaging, which is essential for preserving the quality and shelf life of various products, such as food, pharmaceuticals, and other perishable goods. The OTR test system typically consists of a test chamber, sample holder, and sensors or detectors to measure the oxygen concentration. The packaging material or container being tested is securely placed within the chamber, creating a controlled environment. Oxygen gas is then introduced into the chamber at a specific pressure, while the sensors monitor and record the oxygen levels both inside and outside the package. The system measures how much oxygen gas can pass through the material over a set period of time, typically expressed in units such as cubic centimeters per square meter per day (cc/m²/day). This measurement, known as the oxygen transmission rate (OTR), helps assess the effectiveness of the packaging in preventing oxygen ingress or egress, which can affect product freshness, stability, and shelf life. By accurately determining the OTR, manufacturers and researchers can optimize packaging design and material selection to ensure product integrity. It allows them to develop and validate packaging solutions that minimize oxygen permeation, prolonging the shelf life and maintaining the quality of oxygen-sensitive products.
