Ozone Ambient Monitoring System is a system used to measure and monitor the concentration of ozone in the air. It consists of a network of monitoring stations that are strategically placed in different locations to collect data on ozone levels in the atmosphere. The data collected by the monitoring stations is then used to assess air quality and to develop strategies for reducing ozone pollution.

The system typically consists of a number of different components, including ozone analyzers, data loggers, and communication equipment. The ozone analyzers are used to measure the concentration of ozone in the air, while the data loggers are used to store and transmit the data to a central database. The communication equipment is used to transmit the data from the monitoring stations to the central database in real-time.

In summary, the Ozone Ambient Monitoring System is an important tool for monitoring and managing air quality, particularly in areas where ozone pollution is a concern.
