Abstracts

The global PAH Testing Services market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Polycyclic aromatic hydrocarbons (PAHs) are organic compounds composed of two or more aromatic ring systems. Some of these compounds are generally believed to be carcinogenic. PAHs can be found in elastomers, rubber materials, plastics, varnishes, paints and other coatings. These materials are commonly used to make casters, wheels, toys, shoes, tools, bicycle handles, and many other everyday items. Polycyclic aromatic hydrocarbons (PAHs) are a class of organic pollutants with three effects and are widely distributed around the world, which are potentially harmful to human health. PAHs can enter the human body through various exposure routes such as the respiratory tract, skin contact, and digestive tract, and are metabolized into hydroxy polycyclic aromatic hydrocarbons (OH-PAHs) in the body, which are mainly excreted in urine in the form of glucuronic acid and sulfuric acid conjugates. Some PAHs have strong carcinogenicity, and may also have hazards such as teratogenicity and mutagenicity. In order to reduce the risk of cancer, the German Federal Institute for Risk Assessment (BfR) and the Center for Exchange of Experience (ZEK) are working together to limit the use of these materials. At present, there are more than 100 kinds of PAHs known, and 18 common types of PAHs have been identified so far.
