Abstracts

The global Palatinose Powder market size is expected to reach \$ 273 million by 2032, rising at a market growth of 7.8% CAGR during the forecast period (2026-2032).

In 2024, global Palatinose Powder production reached approximately 36,672 tons, with an average global market price of around US\$ 4,274 per ton. In 2024, the global 's total production capacity of Palatinose Powder reached 43,600 tons. The industry average gross profit margin of this product reached 16%. Paragine powder, commonly known as isomaltulose, is a naturally occurring functional disaccharide that can be prepared using biotechnology. Physically, it is a white crystalline powder with a sweet taste, approximately 42% as sweet as sucrose, and a pure sweetness without any bitter aftertaste. Chemically, it is an isomer of sucrose, consisting of one molecule of glucose and one molecule of fructose linked by an α -1,6 glycosidic bond. This unique structure endows it with a low glycemic index (low GI), low cariogenicity, low hygroscopicity, and good stability under acidic and heat conditions, among other excellent properties. Therefore, it is widely used as a healthy food sweetener and ingredient in various food and beverage products.

The paragine powder industry chain is clearly defined, primarily revolving around biotransformation technology.

The upstream of the industry chain is the raw material supply stage, with sucrose and specialized enzymes used for catalytic conversion as the core raw materials. The midstream is the manufacturing stage, where manufacturers utilize bio-enzymatic conversion technology to isomerize sucrose into palaginose, which is then processed into a powder product through crystallization and drying. The global market was long dominated by a few foreign companies, but China now possesses independent

production technology and has established large-scale production enterprises. The downstream of the industry chain is a broad application market. Due to its health benefits, palaginosé powder is primarily used as a sweetener or functional ingredient, added to beverages, confectionery, baked goods, dairy products, sports nutrition products, and foods specifically for diabetics.

The market prospects for palaginosé powder are very broad, with its core growth driver being the increasing global awareness of health-conscious consumers. With the increasing prevalence of obesity and diabetes, and consumers' growing emphasis on oral health, palaginosé, with its clear health benefits such as a low glycemic index and non-caries properties, is becoming an important alternative to traditional sugars. Early development in the European market has already demonstrated its commercial potential, with a wide variety of applications. In the future, its applications will not be limited to existing sugar-free candies and beverages. In sports foods that require slow-release energy, healthy weight loss meal replacements, and more new foods that pursue "clean labels" and functional claims, Palagin sugar powder has huge development potential and is expected to usher in a period of rapid growth.
