Abstracts

The global Pallet Conveying System market size is expected to reach \$ 1119 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

In 2025, global pallet conveying system production reached approximately 13870 units, the average price is 55 k usd/unit. Pallet conveying system is a material handling system used for automatic handling and storage of standardized pallet cargo units in warehouses, production lines or distribution centers. It is usually composed of conveyor belts, roller lines, chain conveyors, lifting platforms, turntables and automatic guided vehicles, and is integrated with the control system to achieve efficient and orderly transmission and diversion of pallet cargo.

Market Concentration and Key Players:

From an international perspective, the market concentration of pallet conveyor systems is relatively high, mainly concentrated in developed countries such as Europe, America and Japan. For example, large manufacturers such as Dematic and Ssi Schaefer; from the domestic point of view, there is still a lot of room for development of pallet conveyor systems.

Manufacturing Processes and Market Trends:

The manufacturing process of pallet conveying system begins with system design and modular decomposition, planning conveying path according to site layout and process requirements and determining specifications of each functional segment, followed by processing of core mechanical parts, including laser cutting and bending welding of structural parts to make racks, as well as precision manufacturing and surface treatment

of transmission parts such as rollers, sprockets, belts, motor brackets, etc., followed by segmented assembly and debugging, which will drive motors, reducers, Sensor and mechanical structure are assembled into independent conveying modules such as straight line section, curve, confluence and shunt mechanism and lifting turntable to ensure stable operation and accurate positioning. Integration of electrical control system is the central link, including installing programmable controller, frequency converter, switch, etc. in the electrical cabinet, wiring, programming and network configuration are carried out to realize coordination and state monitoring of each module. Finally, field installation and joint adjustment are carried out to position and connect each module. And access to the upper management system for overall function and efficiency testing.

The market trend is towards highly intelligent and flexible development, the system is no longer just a simple transmission, but through the integration of machine vision and RFID technology to achieve intelligent identification and routing of pallets, and more and more as part of the digital twin, real-time data analysis and predictive maintenance, modularity and scalability become key requirements, customers expect the system to quickly adapt to business changes and easy to expand, in addition, the requirements for energy efficiency and noise control are also rising, Promoting the use of low-energy motors and silent design, seamless integration with new equipment such as autonomous mobile robots, is becoming the core direction of building the next generation of flexible logistics solutions.
