Palliative care is a means of improving the quality of life of patients (adults and children) and their families who face life-threatening disease-related problems. This treatment prevents and alleviates suffering through early recognition, proper assessment and management of pain and other physical, psychosocial or spiritual problems. Issues that go beyond physical symptoms need to be addressed. Palliative care uses a team approach to support patients and their caregivers. This includes addressing practical needs and providing bereavement counselling. It provides a support system to help patients live as active a life as possible until death.

Hospice is a type of medical care only provided to people with serious illness who have six months or less to live.

Pain and dyspnea are two of the most common and severe symptoms in patients requiring palliative care. For example, 80% of people with AIDS or cancer and 67% of people with cardiovascular disease or chronic obstructive pulmonary disease experience moderate to severe pain at the end of their lives.
