Abstracts

According to our (Global Info Research) latest study, the global Pamiparib market size was valued at US\$ 123 million in 2025 and is forecast to a readjusted size of US\$ 422 million by 2032 with a CAGR of 10.9% during review period.

In 2025, global Pamiparib production reached approximately 350,000 units. Pamiparib is an oral small-molecule targeted therapy that belongs to the class of Poly(ADP-ribose) polymerase (PARP) inhibitors. It is mainly used to treat tumors with homologous recombination repair deficiencies, such as those with BRCA mutation, including ovarian cancer and breast cancer. It works by inhibiting the activity of PARP enzymes, thereby blocking the repair of DNA damage in cancer cells and ultimately inducing tumor cell death. Pamiparib also has good penetration across the blood–brain barrier, showing potential therapeutic value in tumors with central nervous system metastases.

Pamiparib, as one of the domestically developed innovative PARP inhibitors, is positioned within the rapidly growing targeted anti-cancer drug market. Driven by the increasing adoption of BRCA mutation testing, the advancement of precision medicine, and the rising incidence of cancer, the overall PARP inhibitor market continues to expand. In the Chinese market, Pamiparib holds certain competitive advantages due to its local R&D background, particularly in pricing, reimbursement access, and clinical availability. In addition, its strong ability to penetrate the blood–brain barrier provides a point of differentiation. Currently, the drug is still in the stage of market introduction and volume expansion. Future growth will mainly depend on the expansion of indications (such as breast cancer and ovarian cancer), combination therapy strategies, and international market development. However, it also faces challenges such as intensified competition from other PARP inhibitors and pressure from healthcare cost control policies.
