The global Paper Pulp market size is expected to reach \$ 75528 million by 2032, rising at a market growth of 4.0% CAGR during the forecast period (2026-2032).

Paper pulp is a soft, moist and shapeless material that contains fibers from wood, plants, or paper. It is used to make paper and other paper products by removing the water and forming a sheet on a screen. Paper pulp can be made by separating the fibers from the wood or paper using chemicals or machines. Recycled paper pulp is also called deinked pulp because it has the inks and contaminants removed.

Paper pulp is a lignocellulosic fibrous material prepared by chemically or mechanically separating cellulose fibres from wood, fibre crops or waste paper. The wood fiber sources required for pulping are, 45% sawmill residue, 21% logs and chips, and 34% recycled paper. Pulp is one of the most abundant raw materials worldwide. Paper pulp is the raw material for paper manufacture that contains vegetable, mineral, or man-made fibres. It forms a matted or felted sheet on a screen when moisture is removed. Wood pulp, the most used paper pulp, is a type of material that is created by processing wood collected from trees, and serves as the basis for the creation of a wide range of paper-based products. Several different processes are utilized to reduce the wood into a form that is ideal for manufacturing different types of paper goods, including paper used in printing books, magazines, and newspapers. The resulting paper product can also be used to create other paper products, including disposable paper plates, paper towels, and other common household items.
