## Abstracts

According to our (Global Info Research) latest study, the global Partial Oxidation Blue Hydrogen market size was valued at US\$ 433 million in 2025 and is forecast to a readjusted size of US\$ 905 million by 2032 with a CAGR of 11.1% during review period.

Partial Oxidation Blue Hydrogen refers to low-carbon hydrogen produced by reacting a hydrocarbon feedstock with a sub-stoichiometric amount of oxygen at high temperatures in a partial oxidation reactor, generating a synthesis gas composed primarily of hydrogen and carbon monoxide. In 2025, global partial oxidation blue hydrogen production reached approximately 120,242 ton, with an average global market price of around USD 3,500 per ton. A factory gross profit of USD 770 per ton with 22% gross margin. A single line full machine capacity production is around 3,000 ton per line per year. The upstream is dependent on gas suppliers, catalyst manufacturers. The downstream demand is concentrated in refining, chemical manufacturing and power generation. POX blue hydrogen is used to remove sulfur from crude oil fractions, producing cleaner diesel. US and Canada leads driven by large scale production due to significant government subsidies.
