A chilled beam is a type of convection HVAC system designed to heat or cool large buildings. Pipes of water are passed through a 'beam' (a heat exchanger) either integrated into standard suspended ceiling systems or suspended a short distance from the ceiling of a room.

According to our (Global Info Research) latest study, the global Passive Chilled Beams market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The primary advantage of the chilled beam system is its lower operating cost. For example, because the temperature of cooled water is higher than the temperature of cooled air, but it delivers the same cooling ability, the costs of the cooled water system are lower.
