Passive fixed attenuator is an electronic component used for signal processing, which is used to reduce the strength of electrical signals without introducing significant distortion or noise. It is called 'passive' because it does not need power to work, and 'fixed' because the attenuation level is predetermined and cannot be adjusted. Passive fixed attenuators are usually used when the signal needs to be reduced before further processing or transmission, such as in audio or RF circuits. Attenuation is usually expressed in decibels (dB). The attenuation provided by passive fixed attenuator is determined by the ratio of input resistance to output resistance.
