Abstracts

PMOLED simply forms a matrix with cathodes and anodes, and lights up the pixels in the array in a scanning manner. Each pixel operates in a short-pulse mode to emit high-brightness instantaneously. The advantage is that the structure is simple, which can effectively reduce manufacturing costs. However, the high driving voltage makes PMOLED unsuitable for large-size and high-resolution panels. It is different from the current development. PMOLED is not suitable for displaying dynamic images because the response speed is relatively slow, but it is very energy-saving.
