According to our (Global Info Research) latest study, the global Passive RFID Inlays market size was valued at US\$ 3182 million in 2025 and is forecast to a readjusted size of US\$ 6095 million by 2032 with a CAGR of 9.8% during review period.

A passive RFID inlay is a component that integrates a radio frequency identification (RFID) chip and an antenna into a thin sheet or label. This inlay typically consists of two parts: a miniature RFID chip and an antenna connected to it. The key feature of a passive RFID inlay is that it does not require an internal power source; instead, it is activated and powered by the electromagnetic waves emitted from an external reader, which then enables the chip to transmit data. This technology is widely used in various applications, such as logistics management, asset tracking, retail inventory management, and identity verification.

The primary advantages of passive RFID inlays include low cost, small size, and ease of integration into various labels and packaging. Common forms include paper labels, plastic labels, or embedded tags, suitable for different application scenarios and environmental requirements. For example, in the logistics sector, passive RFID inlays can be attached to goods to enable automated tracking and management. In the retail industry, they can be used for product anti-theft and inventory management. In healthcare, they can be utilized for patient identification and medical equipment management.
