## Abstracts

The global Passive Self-Ligating Brackets market size is expected to reach \$ 304 million by 2032, rising at a market growth of 3.2% CAGR during the forecast period (2026-2032).

Passive self-ligating brackets are fixed orthodontic bracket systems with a built-in slide or locking door that retains the archwire without actively pressing it into the bracket slot. They are designed to reduce friction, support smooth sliding mechanics, improve archwire-change efficiency, and are widely used for alignment, leveling, space closure, and comprehensive fixed orthodontic treatment.

The upstream supply chain includes medical-grade stainless steel, nickel-titanium components, ceramic powders, alumina, precision slides or clips, welding materials, surface-treatment chemicals, and sterile packaging. Midstream production covers bracket design, metal injection molding, CNC micro-machining, ceramic sintering, laser welding, slide assembly, polishing, inspection, and packaging. Downstream sales are mainly handled through orthodontic device brands, dental distributors, dental chains, hospitals, and orthodontic clinics.

In 2025, global passive self-ligating brackets production reached approximately 2 million units, with an average global market price is \$115 per unit.

Global passive self-ligating brackets are a high-value segment of fixed orthodontic appliances. Their defining feature is a built-in slide, clip or door mechanism that holds the archwire in the bracket slot without conventional elastomeric or metal ligatures. Unlike active self-ligating brackets, passive self-ligating brackets generally do not actively press against the archwire when closed; instead, they allow the archwire to move with relatively lower friction inside the slot. As a result, their value proposition is

linked to low-friction alignment, lighter force mechanics, chairside efficiency and easier oral hygiene. They are used in adolescent and adult fixed orthodontic treatment for crowding, spacing, mild-to-moderate malocclusions and selected complex cases, but clinical outcomes still depend heavily on case difficulty, treatment planning, archwire sequence, anchorage control and patient compliance rather than bracket type alone. Self-ligating brackets are commonly defined as brackets that use an integrated movable component to hold the archwire, while passive systems are characterized by a slide that does not infringe on the slot lumen or actively load the archwire.

In terms of industry trends, passive self-ligating brackets are moving toward lower friction, improved comfort, better aesthetics, digital workflow compatibility and higher clinical operating efficiency. Early product positioning focused mainly on fewer ligatures, lower friction and shorter chairside procedures; current development places greater emphasis on slot precision, slide reliability, bracket-wing design, ligation flexibility, torque/control performance and ceramic or clear aesthetic options. With rising adult orthodontic demand, ceramic passive self-ligating brackets and low-visibility systems are gaining more attention alongside metal products. At the same time, digital treatment planning, indirect bonding, customized archwire protocols and intraoral scanning are turning self-ligating brackets from standalone hardware into part of a more integrated orthodontic workflow. However, clinical evidence is mixed on whether self-ligating brackets consistently shorten total treatment time or deliver clearly superior outcomes versus conventional brackets; reported advantages are more credible in areas such as friction reduction, chairside handling and oral-hygiene convenience, while overall treatment efficiency remains strongly case- and protocol-dependent.

The main growth drivers come from three areas. First, growing adult and adolescent orthodontic demand is increasing patient attention to comfort, fewer appointment burdens, easier cleaning and better appearance, making passive self-ligating systems a more visible differentiated option. Second, orthodontic practices are placing greater emphasis on workflow efficiency and standardized procedures, so reduced ligation steps, faster archwire changes and shorter chairside time are important product benefits. Third, improvements in materials, precision manufacturing and digital orthodontic workflows are driving further upgrades in slot accuracy, slide durability, friction control, ceramic aesthetics and system-level treatment integration. Overall, passive self-ligating brackets should not be described simply as a universally 'faster' replacement for conventional brackets; they are better understood as an important fixed-appliance format supporting the broader shift toward efficient, low-friction, hygienic, aesthetic and digitally coordinated orthodontic treatment.
