Abstracts

The global Patent Infringement Risk Assessment market size is expected to reach \$ 653 million by 2032, rising at a market growth of 5.0% CAGR during the forecast period (2026-2032).

Patent infringement analysis is a specialized evaluation process that combines technology and law, with its core being the item-by-item comparison of the technical features of the accused product or technical solution against all the technical features of the target patent claims. The analysis process strictly follows statutory infringement determination principles such as the principle of full coverage and the doctrine of equivalents, aiming to scientifically determine whether infringement has occurred. This analysis not only serves litigation and negotiation but also provides critical decision-making support for product design around patents, technology collaboration negotiations, and business strategy formulation, making it an important component of innovation protection and risk management.

With the accelerating iteration of technological innovation and the increasingly dense global patent layout, the professional value of patent infringement analysis will continue to rise. Its development shows two main directions: first, the diversification of service scenarios, with analysis services extending from traditional litigation response to include product development, technology introduction, and merger and acquisition due diligence, becoming a necessary part of the entire innovation chain; second, the intelligence of analytical tools, where big data analysis and AI-assisted search and comparison will greatly improve the efficiency of preliminary analysis, but in complex cases, core judgments such as legal application, claims interpretation, and integration with business strategy still heavily rely on experts' professional experience and strategic thinking.
