## Abstracts

According to our (Global Info Research) latest study, the global Patient Anti-wandering System market size was valued at US\$ 343 million in 2025 and is forecast to a readjusted size of US\$ 628 million by 2032 with a CAGR of 9.0% during review period.

Patient anti-wandering systems are personnel positioning and behavior monitoring systems specifically designed for scenarios such as hospitals, nursing homes, mental health institutions, and rehabilitation centers. They are primarily used to monitor the activity trajectories of patients, especially those with Alzheimer's disease, mental disorders, and intellectual disabilities, in real time, and automatically trigger alarms when they leave safe areas or exhibit abnormal behavior, thereby reducing the risk of wandering and improving care efficiency. The system typically consists of wearable positioning terminals (wristbands, name tags, tags), beacons/base stations, a positioning algorithm platform, backend management software, electronic fences, and alarm modules. Its core value lies in achieving high-precision positioning, real-time monitoring, automatic early warning, and optimized nursing staff scheduling at the indoor/hospital level. This type of system has become an important component of smart hospital and smart elderly care construction, with demand strongly driven by global population aging and the increasing prevalence of chronic cognitive diseases. With advancements in technologies such as UWB, Bluetooth AoA, RFID, and AI algorithm integration, future patient anti-wandering systems will upgrade towards higher positioning accuracy, lighter equipment, and more intelligent backend management, leading to a continuous increase in market penetration and rapid expansion potential.
