Abstracts

PC-based motion control refers to a system where a personal computer (PC) is used to direct and manage the movement of machines or components in a controlled manner. This technology is integral in industrial automation and is used extensively across various sectors including robotics, manufacturing, and packaging, among others.

A PC-based motion control system typically combines hardware and software to achieve precise control over the motion of motors and actuaries within equipment. The PC serves as the central unit where the motion control software is installed, allowing for complex and precise control algorithms to be executed. This setup is particularly advantageous because of the PC's ability to handle complex computations, its flexibility, and its capacity for integrating various functions and systems into one platform.

According to our (Global Info Research) latest study, the global PC-based Motion Control market size was valued at US$ 1819 million in 2023 and is forecast to a readjusted size of USD 2981 million by 2030 with a CAGR of 7.2% during review period.
