Abstracts

The global PC Fiber Connector Tray market size is expected to reach \$ 145 million by 2032, rising at a market growth of 4.7% CAGR during the forecast period (2026-2032).

PC fiber connector trays are basic passive components used in fiber optic network installation and maintenance, widely applied in telecommunications rooms, fiber distribution frames, FTTx access networks, and data center cabling systems. Their primary function is to organize, secure, and protect fiber splicing points or connectors while maintaining proper bend radius management to reduce optical signal loss and mechanical stress. These trays are typically made of polycarbonate (PC) material, offering high mechanical strength, flame retardancy, and dimensional stability. They are compatible with various fiber adapters and splice tray structures and support modular stacking, making them essential passive components in fiber optic cabling systems. In 2025, the global PC fiber connector tray market is estimated at approximately USD95 million, with annual shipments of around 19 million units, resulting in an average selling price of about USD5 per unit. The market is expected to grow at a CAGR of approximately 4.8%. Typical single-line production capacity ranges from 2,000,000 to 15,000,000 units per year, while industry gross margins generally fall between 20% and 35%.
