## Abstracts

According to our (Global Info Research) latest study, the global PC Power Supply market size was valued at US\$ 5018 million in 2025 and is forecast to a readjusted size of US\$ 4534 million by 2032 with a CAGR of -1.5% during review period.

In 2024, global PC Power Supply production reached approximately 96.3 million units, with an average global market price of around US\$ 51 per unit. A PC power is an electric converter that supplies electric power to an electrical load. To be more specific, a PC power supply converts AC to low-voltage regulated DC power for the internal components of a computer. Modern personal computers universally use switched-mode power supplies. Some power supplies have a manual switch for selecting input voltage, while others automatically adapt to the mains voltage. In this report, PC Power Supply specifically refers to PC power for desktops and industrial computer.

The PC power supply industry is currently witnessing several significant trends, presenting numerous opportunities and challenges. Technological advancements are driving the trend towards higher power efficiency, with more power supplies achieving 80 Plus certification and above, which not only reduces energy consumption but also appeals to environmentally - conscious consumers and businesses aiming to cut operational costs. The rise of high - performance computing, is fueling demand for high - wattage, reliable power supplies, creating an opportunity for manufacturers to target these growing segments. Additionally, the trend of miniaturization in PC designs has led to an increased need for compact yet powerful power supplies. However, the industry also faces challenges. Intense competition from a large number of manufacturers, both established and emerging, makes it difficult for companies to differentiate their products and maintain profit margins. Fluctuations in the prices of raw materials, such as copper

and aluminum used in power supply components, pose cost - management challenges. Moreover, as technology evolves rapidly, power supply manufacturers must continuously invest in research and development to keep up with the changing power requirements of new PC components, like more power - hungry GPUs and CPUs, while also ensuring compatibility across a wide range of systems.
