## Abstracts

According to our (Global Info Research) latest study, the global PCB Electroless Palladium Plating Solution market size was valued at US\$ 28.87 million in 2025 and is forecast to a readjusted size of US\$ 39.71 million by 2032 with a CAGR of 4.6% during review period.

PCB electroless palladium plating solution is a palladium-containing chemical solution used to deposit a layer of palladium (Pd) metal onto the copper surface of printed circuit boards (PCBs) through a chemical reaction. It is typically used as an intermediate layer in the 'electroless nickel palladium gold' (ENEPIG) process, providing excellent conductivity, corrosion resistance, and good solderability. Acting as a protective and connecting layer between the gold and copper layers, it ensures the long-term reliability of the PCB.

The upstream segment is mainly divided into precious metal raw materials (such as palladium chloride, palladium sulfate, and other palladium salts) and specialty chemical additives (such as complexing agents, stabilizers, and accelerators). Since palladium is a scarce precious metal, its price fluctuations directly determine the production cost of the chemical solution. In 2025, global sales are projected to be approximately 610 tons, with an average market price of approximately US\$46 per kilogram. The industry's gross profit margin is approximately 30-45%.
