Abstracts

According to our (Global Info Research) latest study, the global PCR Reaction Nucleotides market size was valued at US\$ 334 million in 2025 and is forecast to a readjusted size of US\$ 644 million by 2032 with a CAGR of 9.8% during review period.

PCR reaction nucleotides refer to deoxynucleoside triphosphate substrates used as raw materials for DNA synthesis in polymerase chain reaction (PCR). They typically consist of four types: deoxyadenosine triphosphate (dATP), deoxythymidine triphosphate (dTTP), deoxycytidine triphosphate (dCTP), and deoxyguanosine triphosphate (dGTP). In the PCR amplification reaction, these nucleotides are continuously added to the newly synthesized DNA strand under the catalysis of DNA polymerase, according to the base pairing rules of the template DNA, thereby achieving exponential amplification of the target DNA fragment. PCR reaction nucleotides are usually provided in the form of mixed reagents (i.e., dNTP Mix) and are widely used in molecular biology fields such as gene detection, molecular diagnostics, gene cloning, DNA sequencing, and scientific research experiments. In 2025, sales volume was 310,000 units, with an average price of \$1,050, total production capacity of 400,000 units, and a gross profit margin of 85%.
