Abstracts

The global PE Breathable Film market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

PE breathable membrane is mainly used in the fields of protective clothing, diapers and feminine sanitary napkins. With the outbreak of the new crown epidemic, the polyethylene (PE) breathable film special material industry has been further developed. It is expected that in the next few years, the supply of special materials for polyethylene (PE) breathable film industry will show a growing trend year by year

PE breathable film is a new type of breathable and impermeable material. In the production process of polyethylene, some 4-carbon or 8-carbon α -olefins are added as comonomers, but because α -olefins are rarely used, polyethylene Ethylene also maintains many properties, and the main component of PE breathable film is polyethylene. It is made of LDPE/LLDPE polyethylene resin carrier, adding about 50% of special calcium carbonate for blending, extruding and stretching to a certain ratio after forming a film. There are two main processing methods, one is flat film Casting method, the other is blown film method. In China and even Asia, most of Europe and the United States use casting method. The main process flow of tape casting method is as follows: PE raw material + porogen \rightarrow mixing and metering \rightarrow extrusion granulation \rightarrow extrusion casting \rightarrow stretching and setting \rightarrow cooling \rightarrow trimming \rightarrow coiling. Throughout the process, the effect of the stretching process on the properties of the film is very important. During stretching, when the binding force of the porogen CaCO_3 particle and its surrounding PE polymer is less than the deformation force of the PE polymer caused by stretching, the polymer will separate along the edge of the CaCO_3 particle, resulting in some Tiny cavities, liquid molecules cannot pass through these cavities, only gaseous molecules can pass through, so the stretched film has waterproof and

breathable properties. The size of the void can be adjusted according to the process conditions such as the size, form, stretching method, and stretching ratio of CaCO₃ particles. When the stretching temperature reaches a certain value, as the stretch ratio increases, the pore size of the PE breathable film increases, the air permeability increases, and the stretch performance deteriorates; as the thickness increases, the air permeability decreases.
