According to our latest research, the global PE Hollow Profile Sheet Extrusion Line market size will reach USD 1425 million in 2031, growing at a CAGR of 3.5% over the analysis period.

PE Hollow Profile Sheet Extrusion Line is a production line used to manufacture polyethylene (PE) hollow profile sheets.

Components of the Production Line:

- Feeding System: Usually includes hoppers and conveyors. The hopper stores the PE raw materials, and the conveyor transports the raw materials to the extruder at a controlled speed to ensure a continuous and stable supply of materials.
- Extruder: The core component of the production line. It heats and melts the PE raw materials through a screw-barrel mechanism. The extruder applies high pressure to force the molten PE through the die, forming the initial shape of the hollow profile sheet.
- Die: It is designed to give the molten PE the specific cross-sectional shape of the hollow profile sheet. The die has a precise structure to ensure the uniformity of the sheet's thickness and the accuracy of the hollow profile.
- Cooling System: After the sheet exits the die, it needs to be cooled and solidified quickly. The cooling system typically uses methods such as air-cooling or water-cooling to reduce the temperature of the sheet, ensuring its dimensional stability and mechanical properties.

- Calibration Device: This device is used to further calibrate the dimensions and shape of the cooled sheet, ensuring that the final product meets the required standards. It may include rollers or other mechanical structures to apply gentle pressure and adjust the sheet's flatness and thickness.

#????

The PE Hollow Profile Sheet Extrusion Line works by first melting the PE resin particles in the extruder. The molten PE is then forced through the die under high pressure, where it takes on the shape of a hollow profile sheet. As the sheet emerges from the die, it is cooled rapidly to solidify its structure. Finally, the sheet is calibrated and wound up for packaging and shipment.
