Abstracts

The global Pea Derivatives market size is expected to reach \$ 6122.5 million by 2029, rising at a market growth of 11.0% CAGR during the forecast period (2023-2029).

One of the most significant drivers of the market is consumer interest in plant-based alternatives to animal products. As more consumers seek meat- and dairy-free options, the pea protein and other derivatives market are likely to exhibit continuous growth. The market experiences growth due to the rising demand for peas, particularly in developing regions. Commercially grown varieties include yellow peas and green peas, with yellow peas spearheading global production.

The leguminous family's highly cultivated pea is a nutrient-dense pulse crop. The solubility, ability to hold both water and oil, ability to form emulsions, ability to gel, and viscosity of pea derivatives are all great functional qualities. They contain high-quality proteins, starch, carbs, dietary fibers, and micronutrients like vitamins and minerals. Moreover, it is enhanced with non-nutritional phytochemicals, antioxidants, flavonoids, tannins, and other phenolic compounds. By fostering intestinal bacteria, dietary fiber taken from a cell wall's cotyledon, seed coats, and pods has been shown to hasten gastrointestinal activity. By lowering the glycemic index and decreasing the digestion of pea starch, intermediate amylose helps to keep blood sugar levels stable.
