The global Pectus Excavatum Correction Plate market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Pectus excavatum is the most common chest wall deformity in children and adolescents. Due to the compression of the heart and lungs by the sunken sternum, it causes symptoms such as obstructed organ development, respiratory tract infections, and decreased activity endurance, which also has a great impact on the psychological development of adolescents. Pectus pectus plate includes T-shaped plate, curved steel plate and fixing strip, which can further simplify and optimize the operation, shorten operation time and reduce operation trauma on the basis of NUSS operation, so as to improve operation effect and success rate, reduce patient pain and save operation costs, and shortened hospital stays.
