The global PEEK Insulated Wire market size is expected to reach \$ 618 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

PEEK insulated wire is a wire that uses PEEK material as the insulation layer. PEEK (polyetheretherketone) is a high-performance plastic with excellent high temperature resistance, chemical resistance, flame retardancy and other properties. PEEK insulated wire is usually composed of conductor, insulation layer, filling layer, wrapping layer and sheath layer. It performs well in harsh environments such as high temperature and chemical corrosion.

The core upstream raw material is PEEK resin. Its synthesis involves extremely high technological barriers, with the primary monomers being 4,4'-difluorobenzophenone and hydroquinone. Global production capacity has long been supplied by Victrex, Solvay, and leading Chinese enterprises such as Zhongyan Shares and Jida Special Plastic. The core midstream stage involves the extrusion molding process. Given PEEK's high melting point, the extrusion equipment requires exceptional temperature control precision as well as specialized heat-resistant molds. The core competitiveness of midstream manufacturers lies in their ability to address adhesion between PEEK and the conductor (copper, silver, or alloys), control crystallinity, and ensure concentricity for wires with minute diameters.

The price of PEEK-insulated wire products is significantly higher than that of ordinary enameled wire; standard PEEK-insulated wire typically ranges from approximately \$50 to \$130 per kilogram, while high-end products can exceed \$130–\$200 per kilogram. By 2025, the sales volume of finished wire products is projected to reach approximately 3,180 tons. The industry's overall gross profit margin stands at approximately

25%–40%.

PEEK-insulated wire is currently transitioning from its traditional role as a 'specialized cable for extreme environments' to becoming a 'critical material for high-voltage motors in new energy vehicles.' Historically, PEEK-insulated wire was primarily deployed in scenarios demanding high temperature, high pressure, strong corrosion resistance, and exceptional reliability—such as downhole oil and gas operations, nuclear power generation, aerospace, and electrical equipment. From a medium-to-long-term perspective, high-voltage motors (rated at 800V and above) for new energy vehicles, flat-wire motors, and high-power-density drive systems are poised to become the most significant areas of incremental growth. The key barriers to entry for PEEK-insulated wire production lie in the technical complexities of PEEK extrusion coating, conductor surface treatment, ensuring uniformity in insulation layer thickness, adhesion strength, adaptability to bending and forming processes, and long-term thermal aging validation. This is particularly true for PEEK-insulated flat wire intended for new energy vehicles, which must also satisfy stringent automotive-grade consistency standards and meet rigorous long-term validation requirements set by customers.
