The global Peer-to-peer Screen Sharer market size is expected to reach \$ 2838 million by 2032, rising at a market growth of 9.3% CAGR during the forecast period (2026-2032).

A Peer-to-peer Screen Sharer is an electronic device or system that enables real-time wireless transmission of screen content between source devices and display terminals. It is mainly used to share screens from laptops, smartphones, tablets, conferencing terminals, and multimedia devices to TVs, monitors, projectors, or large-format displays. Typical products consist of transmitters, receivers, wireless communication modules, video codec chips, interface controllers, power management systems, and antenna modules. Some products use integrated all-in-one structures, while others separate transmitter and receiver units. Common product forms include compact boxes, dongles, docking-style units, and wireless presentation buttons. Interfaces usually include HDMI, USB, LAN, and power connectors. The operating principle relies on Wi-Fi, peer-to-peer wireless communication, millimeter-wave transmission, or proprietary low-latency protocols to encode, compress, transmit, decode, and display video, audio, and control signals in real time. Wireless Presentation Systems can be divided into consumer wireless casting devices, enterprise collaboration systems, educational wireless presentation systems, and professional AV wireless transmission systems. These products are widely used in conference rooms, classrooms, home entertainment, exhibition halls, commercial displays, and remote collaboration environments. Current manufacturers mainly include consumer electronics companies, professional AV vendors, conferencing solution providers, and wireless transmission equipment manufacturers.

The market opportunities for Wireless Presentation Systems mainly come from hybrid

working trends, digital collaboration upgrades, and the growing demand for cable-free meeting environments. Enterprises increasingly want to simplify conference room deployment and allow employees to share content wirelessly from laptops, tablets, and smartphones without complicated cabling. Educational digitalization and smart classroom construction are also driving demand for flexible multi-screen interaction between teachers and students. At the same time, the adoption of large-format displays, conference flat panels, and laser projectors has transformed wireless presentation from an optional accessory into a standard collaboration function. In the consumer market, home entertainment, gaming, live streaming, and mobile working are further expanding demand for wireless display solutions. As wireless network performance improves, low-latency video codec chips mature, and wireless HDMI technologies advance, Wireless Presentation Systems are evolving from simple screen-casting devices into integrated collaboration platforms combining presentation, device management, multi-user sharing, and remote interaction.

The challenges and risks are also significant. Wireless Presentation Systems must simultaneously handle wireless communication, video compression, interface compatibility, content protection, and low-latency transmission, making product stability and compatibility highly demanding. Different operating systems, resolutions, display protocols, and enterprise network environments may lead to black screens, unstable connections, lag, audio-video synchronization issues, or pairing failures. The rapid increase of low-cost consumer-grade products has intensified price competition and product homogenization, while many suppliers rely on generic hardware solutions without strong long-term firmware maintenance capability. Meanwhile, the market also faces competition from software-based conferencing platforms, operating-system-level screen mirroring, and smart TVs with built-in casting functions. Companies without strong software ecosystems, enterprise management functions, and after-sales support may struggle to enter mid-to-high-end enterprise markets. In addition, strict wireless certification, electromagnetic compatibility, and cybersecurity requirements in Europe and North America increase export barriers.

Downstream demand will become increasingly enterprise-oriented, platform-based, and low-latency focused. Enterprise customers are paying more attention to centralized management, multi-device compatibility, secure encryption, and remote maintenance capabilities, meaning that low-cost wireless HDMI products alone may no longer satisfy large organizations. Educational and training environments place greater emphasis on multi-user interaction, collaborative sharing, and classroom management. Consumer markets, meanwhile, continue to prioritize plug-and-play simplicity, portability, and affordability. Over the next several years, the market will likely maintain a mixed

structure consisting of enterprise wireless presentation systems, consumer wireless HDMI devices, operating-system-level casting, conferencing collaboration platforms, and low-latency millimeter-wave transmission solutions. The most competitive suppliers will be those capable of integrating wireless communication technology, audiovisual codec capability, cross-platform compatibility, collaboration software ecosystems, and enterprise-grade deployment services.
