Abstracts

The global PEG-modified Drugs (Recombinant Proteins-Polypeptides) market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

PEG-modified drugs have the following advantages: improving drug solubility, increasing drug stability, prolonging blood drug half-life, reducing immunogenicity, and regulating drug release rate. PEG-modified drugs have been successfully used in many fields, such as antibody drugs, protein kinase inhibitors, peptide drugs, etc. They have better biocompatibility, stability and controlled release properties, which provide a new way to improve the efficacy of drugs and obtain better therapeutic effects.

PEG-modified drugs (recombinant proteins/polypeptides) refer to the formation of PEG-modified complexes by covalently linking polyethylene glycol molecules to recombinant proteins or polypeptide drugs. This modification can endow the drug with many beneficial properties, improving its pharmacological and biological properties.
