According to our (Global Info Research) latest study, the global PEGylation Proteins Technology market size was valued at USD 1791.4 million in 2022 and is forecast to a readjusted size of USD 3598.8 million by 2029 with a CAGR of 10.5% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Poly(ethylene glycol) (PEG) is a widely used polymer in drug delivery systems and is often directly conjugated to a drug therapeutic. PEG is a water-soluble, biologically inert, non-immunogenic synthetic polymer consisted of ethylene glycol (-CH₂-CH₂-O-) in repeating units. PEG is produced by anionic polymerization of ethylene oxide initiated by a nucleophilic attack of a methoxide ion on the epoxide ring. PEGylation of a protein conjugate is the process by which PEG is either non-covalently or covalently attached to a potential protein, peptide or antibody of interest to produce alterations in the physiochemical properties of the macromolecule in areas like conformation, electrostatic binding and hydrophobicity. PEGylation is used as a strategy to overcome challenges such as instability, inadequate circulation half-life and immunogenicity of a drug candidate intended for a therapeutic use.
