Abstracts

According to our (Global Info Research) latest study, the global PEM Hydrogen Production Electrolysers market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

The PEM hydrogen electrolyzer is a technical device that uses electricity to produce hydrogen by electrolyzing water. In this system, the proton exchange membrane acts as an electrolyte, allowing only hydrogen ions (protons) to pass through while blocking electrons, forcing the process of water decomposition into hydrogen and oxygen to occur at two different electrodes. Hydrogen is produced at the cathode and oxygen is produced at the anode. The PEM electrolyzer is regarded as one of the important ways to produce hydrogen energy in the future due to its high efficiency, fast response capability and operational flexibility.
