Abstracts

According to our (Global Info Research) latest study, the global Pentafluorosulfanyl Compound market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Pentafluorosulfanyl compounds are a class of substances in which one fluorine atom in the hexavalent sulfur compound sulfur hexafluoride is replaced by other organic groups. Pentafluorosulfanyl compounds have a high dipole moment ($\mu=3.44\text{D}$), which makes them exhibit unique properties in terms of intermolecular interactions and molecular polarity. Pentafluorosulfanyl has a high Pauling electronegativity (3.62), which makes it exhibit strong electronegativity in chemical reactions and easily interacts with other positively charged groups. Pentafluorosulfanyl compounds also have good lipid solubility ($\log P=1.23$), which makes them easy to pass through lipid membranes in vivo, thus having potential biological activity.

In the field of medicinal chemistry, pentafluorosulfanyl is regarded as a bioisostere of trifluoromethyl, sometimes called 'Super CF₃'. This discovery provides new ideas for the development of new drugs. For example, pentafluorosulfanyl analogs show potential in the treatment of diseases corresponding to serotonin receptor 5HT₆ (such as movement disorders, depression, anxiety, etc.). In addition, pentafluorosulfanyl compounds also show broad application prospects in other drug research and development fields, such as anticancer drugs and antibacterial agents.
