Abstracts

The global Pepsin market size is expected to reach \$ 60.91 million by 2032, rising at a market growth of 9.6% CAGR during the forecast period (2026-2032).

Pepsin is a type of aspartic acid hydrolase whose zymogen (pepsinogen) is released by the chief cells in the stomach and that degrades food proteins into peptides. It is also a type of protease. It was discovered in 1836 by Theodor Schwann, then in 1928, it became one of the first enzymes to be crystallized, by John H. Northrop. Pepsin, cooperating with chymotrypsin and trypsin, is one of three principal protein-degrading, or proteolytic, enzymes in the digestive system. The three enzymes were among the first to be isolated in crystalline form. The product has an average price of approximately US\$240 per kg and global sales of approximately 131 tons.

Upstream production relies on animal stomach tissue or microbial fermentation feedstocks, with key parameters being enzyme activity units and purity. Midstream companies extract, purify, freeze-dry, and standardize packaging. Downstream applications cover pharmaceuticals, food, leather, and testing. Future development trends include recombinant and microbial fermentation sources replacing animal sources, improving sustainability and batch stability, while simultaneously promoting pharmaceutical-grade high-purity products.
