## Abstracts

According to our (Global Info Research) latest study, the global Pepsinogen I (PGI) Assay Kit market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Pepsinogen I (PGI) Assay Kit is used for the quantitative determination of pepsinogen ? (PG?) in human serum. Pepsinogen (PG), an inactive precursor of pepsin, is divided into two subgroups based on its biochemical properties and immunogenicity. The immunogenicities of components 1-5 are equally called PG-?, which is secreted by the main cells of gastric glands and mucous neck cells, while components 6-7 are called PG-?, which is secreted by the main cells of acid secreting glands in the fundus mucosa of the stomach, and PG-? can also be produced by the mucous neck cells of acid secreting glands, the mucous cells of the cardiac gland and the pyloric gland in the gastric antrum, and the Brunner gland in the upper duodenum. The prostate and pancreas also produce small amounts of PG-?. Under normal conditions, about 1% PG enters the blood circulation, and the amount of PG entering is very stable. Therefore, serum PG? and ? reflect the number of glands and cells of gastric mucosa, and indirectly reflect the secretion function of different parts of gastric mucosa.
