## Abstracts

According to our (Global Info Research) latest study, the global Peptic Ulcer Drugs market size was valued at US\$ 20020 million in 2025 and is forecast to a readjusted size of US\$ 25760 million by 2032 with a CAGR of 3.7% during review period.

Peptic ulcer drugs are medications specifically designed to treat and manage peptic ulcers, which are sores that develop on the lining of the stomach, small intestine, or esophagus due to the erosion caused by stomach acid. These drugs work by reducing stomach acid production, protecting the stomach lining, or eradicating the bacteria *Helicobacter pylori*, which is commonly associated with ulcer formation. The main classes of peptic ulcer drugs include proton pump inhibitors (PPIs), such as omeprazole and esomeprazole, which effectively lower acid secretion by inhibiting the proton pumps in the stomach lining. H<sub>2</sub>-receptor antagonists, like ranitidine and famotidine, also reduce acid production by blocking histamine receptors on acid-producing cells. Additionally, antacids neutralize existing stomach acid to provide immediate relief from ulcer-related symptoms. Other medications, such as sucralfate, create a protective barrier over the ulcer to aid healing, and antibiotics are used in combination therapies to eradicate *H. pylori*. These drugs play a crucial role in alleviating symptoms, promoting healing, and preventing ulcer recurrence, significantly improving the quality of life for individuals suffering from peptic ulcers.

The main global Peptic Ulcer Drugs players include Takeda Pharmaceutical, AstraZeneca, Pfizer, Teva Pharmaceuticals, EA Pharma, etc. The top five Peptic Ulcer Drugs players account for approximately 43% of the total market. United States is the largest consumer market for Peptic Ulcer Drugs, accounting for about 30%, followed by Europe and China. In terms of type, Proton Pump Inhibitors is the largest segment, with a share over 68%. And in terms of application, the largest application is Hospital and

Clinic, followed by Drugstore.

The market for peptic ulcer drugs is evolving rapidly, driven by advancements in treatment options, increasing prevalence of gastrointestinal disorders, and a growing focus on personalized medicine. Proton pump inhibitors (PPIs) continue to dominate the market due to their efficacy in reducing stomach acid production and promoting ulcer healing. However, there is a notable shift towards exploring alternative therapies and combination treatments to address issues such as antibiotic resistance and long-term PPI use side effects. H2-receptor antagonists remain relevant, especially for patients who experience fewer side effects or need cost-effective solutions.

Recent trends highlight a growing interest in novel drug formulations and over-the-counter (OTC) options, as well as an increased emphasis on targeted therapies that address specific causes of ulcers, such as *Helicobacter pylori* infection. The market is also seeing innovations in drug delivery systems and adjunctive therapies designed to enhance treatment outcomes and patient compliance. Furthermore, rising awareness and diagnostic advancements are contributing to early detection and management of peptic ulcers, further driving market growth.
