Abstracts

According to our (Global Info Research) latest study, the global Peptoids market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Peptoids are peptide-mimicking polymers composed of glycine subunits in which the side chains are located on the nitrogen atoms of the amide backbone, rather than on the alpha carbon as in peptides. Peptoids lack conformational rigidity compared to alpha peptides, and the location of the monomer side chains on the amide nitrogen renders the peptoid backbone achiral. The amide bond is now tertiary, and the absence of amide protons means that the secondary structure cannot be stabilized by hydrogen bonds as in peptides. These properties make peptoids highly flexible, with properties determined by side chain characteristics and monomer sequence. Peptoid synthesis services meet the needs of target discovery and lead drug development research for peptide drugs. Peptoids have potential applications in medicine, nutrition, food, agriculture and cosmetics, and can be used as antibiotics, hormone substitutes, sports supplements and plant growth regulators.
