## Abstracts

The global Peramivir Intermediate market size is expected to reach \$ 11.26 million by 2032, rising at a market growth of 6.6% CAGR during the forecast period (2026-2032).

In 2025, based on a combined calculation of multiple route intermediates, the global sales volume of Peramivir Intermediate was approximately 45 tons, with an average global market price of about USD 155/kg. The gross margin of major producers in the industry was approximately 30%-50%.

Peramivir Intermediate refers to a group of specialized organic synthesis intermediates formed around the construction of the peramivir molecular skeleton. It is not a single fixed compound, but includes multiple route intermediates with different structures and CAS numbers. These products generally feature structural characteristics such as chiral cyclopentane, cyclopentene, isoxazole, Boc-protected amino groups, carboxylate esters, and hydroxy amino groups. Their synthesis typically involves chiral control, introduction and removal of protecting groups, functional group transformation, selective reduction, esterification, or hydrolysis. Due to structural differences among intermediates at different route stages, their appearance, purity, impurity profile, stability, and storage conditions may vary.

The upstream industry chain of Peramivir Intermediate mainly includes chiral cyclopentene/cyclopentane raw materials, guanidination reagents, Boc protection reagents, carboxylate esterification reagents, solvents, catalysts, reducing agents, and acid-base reagents. Downstream, it is mainly used to produce peramivir API, which can be further processed into peramivir trihydrate or finished dosage forms such as peramivir injection.
