Abstracts

According to our (Global Info Research) latest study, the global PERC Front Silver Paste market size was valued at US\$ 1402 million in 2025 and is forecast to a readjusted size of US\$ 1749 million by 2032 with a CAGR of 3.2% during review period.

PERC front silver paste is a screen-printable, fire-through silver-based metallization paste used to form the front-side grid electrodes (fingers/busbars) on PERC crystalline-silicon solar cells. During firing, the paste enables electrical contact through the front SiNx antireflection/passivation layer to the emitter while maintaining low resistivity and good adhesion.

Upstream, it is typically formulated from silver powder (conductive phase), glass frit (inorganic binder/contact-enabling phase), and an organic vehicle (binders/solvents + rheology/dispersing additives). The glass frit chemistry (often PbO-containing or lead-free variants) is crucial for reacting with/penetrating the SiNx layer and assisting contact formation during firing. Downstream, the paste is used in PERC cell lines via screen printing ? drying ? belt-furnace co-firing, producing the final front Ag grid; the cells are then interconnected and laminated into PV modules.

In 2025, global sales of PERC front silver paste reached approximately 1,415 tons, with an average global market price of around US\$ 963/kg. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 5% to 20%.
