## Abstracts

According to our (Global Info Research) latest study, the global PERC Silver Paste market size was valued at US\$ 2182 million in 2025 and is forecast to a readjusted size of US\$ 2721 million by 2032 with a CAGR of 3.1% during review period.

PERC silver paste is a thick-film, screen-printable conductive silver paste used to form metallization on crystalline-silicon PERC solar cells. In practice it includes (at least) front-side Ag contact paste (typically “fire-through” to contact the emitter through SiN?) and rear-side Ag paste for pads/busbars designed to work with the rear passivation/contact scheme used in PERC cells.

Upstream, silver paste is formulated from silver powder + glass frit + organic vehicle (binders/solvents) + additives; the glass frit is critical for contact formation and adhesion during firing.

Downstream, it is used mainly in screen-printed metallization followed by drying and firing/co-firing to create low-resistance current-collecting electrodes.

In 2025, global sales of PERC silver paste reached approximately 2,216 tons, with an average global market price of around US\$ 957/kg. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 5% to 20%.
