## Abstracts

The global Perfluorosulfonic Acid Ion-Exchange Resin market size is expected to reach \$ 2183 million by 2032, rising at a market growth of 5.6% CAGR during the forecast period (2026-2032).

Perfluorosulfonic acid ion exchange resin refers to a strong acidic cation exchange resin with perfluorocarbon main chain as the skeleton and side chains containing sulfonic acid groups, also known as PFSA ion exchange resin. This type of material combines the strong acid resistance, strong alkali resistance, oxidation resistance, high temperature resistance, and chemical stability of fluororesin, as well as the cation exchange and proton conductivity brought by sulfonic acid groups. According to the end group morphology, it can be divided into sulfonyl fluoride type, sodium salt type, and proton type; According to product form, it can be divided into resin particles, resin powder, ionomer dispersion, film grade resin, and coating resin. Perfluorosulfonic acid ion exchange resin is a special polymer in fluorine-containing polymer materials, which has extraordinary stability and chemical resistance. It is widely used in chlor alkali industry, Proton-exchange membrane fuel cell, lithium ion secondary battery, other electrolysis devices, sewage treatment, chemical catalysis, photocatalysis, gas separation, functional composites, especially Electroactive polymer for robots and other fields. In 2025, global Perfluorosulfonic Acid Ion-Exchange Resin production reached approximately 3,675 MT with an average global market price of around US\$ 394 per kg.

Perfluorosulfonic acid ion exchange resin belongs to a key sub category in high-end fluorine materials and electrochemical materials, with a relatively limited market size. However, it has high unit price, high technical barriers, and long customer verification cycles, making it of strong strategic value. Traditional demand mainly comes from chlor alkali ion membranes and high-end electrochemical separation membranes, while new

demand mainly comes from fuel cells, PEM electrolysis for hydrogen production, flow batteries, hydrogen energy equipment, and membrane electrode materials. With the global promotion of green hydrogen energy, fuel cell commercial vehicles, energy storage systems, and high-end ion membrane localization, the demand for PFSA resin will continue to grow, especially for products with low equivalent weight, high ion exchange capacity, short side chains, high proton conductivity, and high durability. In the future, the focus of competition will be on monomer synthesis, polymerization control, end group conversion, dispersion stability, membrane level processing performance, low gas permeability, resistance to free radical attacks, long-term life verification, and scale cost reduction capabilities. Overall, perfluorinated sulfonic acid ion exchange resin is a small-scale, high-value, and high threshold material. Its future growth will mainly be driven by PEM electrolysis of water, fuel cells, updates to chlor alkali ion membranes, and the construction of domestic supply chains.
