Abstracts

The global Perfluorotriethylamine market size is expected to reach $ 18.80 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

In 2025, global sales volume of perfluorotriethylamine was approximately 95 tons, with a mainstream enterprise-level average selling price of about USD 135/kg. The gross margin of major manufacturers in the industry was approximately 38%?58%.

Perfluorotriethylamine, with CAS number 359-70-6 and molecular formula C6F15N, is a specialty fluorinated liquid belonging to the perfluorinated tertiary amine family. Its molecular structure can be understood as a highly fluorinated compound derived from triethylamine, in which the hydrogen atoms are largely replaced by fluorine atoms. As a result, it exhibits strong chemical inertness, thermal stability, electrical insulation properties and low reactivity. The product is typically a colorless transparent liquid with relatively high volatility and a low boiling point, and is classified as a high-fluorine, low-surface-energy functional fluorinated fluid.

The upstream raw materials of perfluorotriethylamine mainly include triethylamine or related organic amine feedstocks, anhydrous hydrogen fluoride, fluorine gas or other fluorinating agents, as well as equipment and refining auxiliaries required for processes such as electrochemical fluorination and direct fluorination. Its production process requires strict control over fluorination reactions, impurity separation, acidic residue removal, moisture control and purity stability. Downstream demand is mainly concentrated in electronic and electrical, aerospace, precision equipment and specialty chemical applications. It can be used as a heat-transfer cooling medium, electrical insulating liquid, inert fluorinated fluid, specialty cleaning medium and functional fluid for fluorinated material R&D.
