The global Pericardiocentesis market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Pericardiocentesis is a procedure done to remove fluid that has built up in the sac around the heart (pericardium). It is carried out using a small needle and catheter to drain excess fluid later the fluid is tested to help diagnose an infection, cancer, or the cause of extra fluid surrounding the heart. This is an invasive procedure carried out by surgeon, an interventional cardiologist or cardiologist and surgeons. The indications that lead to the need of pericardiocentesis procedure are kidney failure, hypothyroidism, cancer, HIV/AIDS, medications such as Nydrazid for tuberculosis & Dilantin for seizures, trauma near the heart, metastatic cancer from other organs, autoimmune diseases viral, bacterial, fungal, or parasitic infections, congestive heart failure, and ventricular aneurysm rupture.
