According to our (Global Info Research) latest study, the global Periodic Inspection Services for Nuclear Facilities market size was valued at US\$ 2331 million in 2025 and is forecast to a readjusted size of US\$ 3132 million by 2032 with a CAGR of 4.2% during review period.

Nuclear facility periodic inspection services, commonly referred to as 'in-service inspections,' refer to systematic safety inspections and evaluations that are mandatorily conducted according to national nuclear safety regulations and standards over the entire operational life of a nuclear facility at predetermined intervals. The core objective is to verify the structural integrity and performance of safety-critical components such as reactor pressure vessels, piping systems, and steam generators through a series of non-destructive testing techniques, and to promptly identify and assess potential material degradation, defects, or fatigue damage. This service is a key element of the nuclear safety regulatory system, aimed at independently and objectively confirming that nuclear facilities continuously meet safety operation requirements, providing technical evidence for the extension of nuclear safety licenses, and essentially serving as a 'mandatory health check' to ensure the long-term safe operation of a nuclear facility.

The prospects of this service are broad and closely linked to the global development of nuclear power and the aging trend of existing units. In the short term, as major nuclear power countries such as China enter large-scale operation phases, the stable and continuous inspection demand generated by the existing more than 50 operational units forms the basic market. Medium-term development will be driven by technological innovation: advanced inspection technologies represented by intelligent robots and AI-assisted diagnostics are shifting from 'optional' to 'essential,' capable of reaching high-

radiation areas difficult for personnel to access, improving inspection accuracy and efficiency, and fostering new technical service models. The long-term outlook is closely related to life extension and decommissioning activities, with a large number of units conducting in-depth safety assessments to extend operations by 20 years or achieve safe decommissioning, generating higher-level demand for more complex and systematic inspection services, and leading the industry from periodic inspections to full-lifecycle asset management services.
