The global Periodic Signal Instrument market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A periodic signal instrument is a device used to generate and analyze periodic signals. It is commonly used in electronic engineering and telecommunications to test and measure the characteristics of signals, such as frequency, amplitude, and phase. The periodic signal instrument can generate various periodic signals, including sine wave, square wave, sawtooth wave and triangular wave. It can also be used to analyze the spectrum of signals, which helps identify the presence of harmonic frequencies and other signal distortions. Some common types of periodic signal instruments include function generator, signal analyzer and oscilloscope. These instruments are used for various applications, such as testing and troubleshooting electronic circuits, designing and testing communication systems, and analyzing the performance of audio and video equipment.
