Abstracts

Peripheral Cutting Balloon (PCB) is designed to minimize vessel trauma with its unique mechanism of action. Peripheral cutting balloon is an interventional technique in which a balloon is inserted and scraped along the inner wall of the blood vessel. It is commonly used to treat cardiovascular diseases such as atherosclerosis. The process of a peripheral cutting balloon involves inserting a small balloon into the artery to be treated and then inflating the balloon to a certain pressure. While inflated, the balloon is pushed against the artery wall to scrape and remove the hardened material from the area. This avoids the risks of surgery while effectively restoring natural arterial shape and blood flow. Peripheral cutting balloon is generally a safe and effective treatment and has been widely adopted.

According to our (Global Info Research) latest study, the global Peripheral Cutting Balloon (PCB) market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
