According to our (Global Info Research) latest study, the global Peripheral Rotational Atherectomy market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Peripheral Rotational Atherectomy is an interventional technique used to remove calcified or hardened plaques from peripheral blood vessels to improve blood flow. It is commonly used in the treatment of peripheral artery disease, such as lower limb arterial occlusive disease. When conventional treatments like balloon angioplasty or stent placement are ineffective for heavily calcified lesions, the procedure uses a high-speed rotating burr to grind the plaque into small particles, which are then carried away by the bloodstream, restoring vessel patency.
