According to our (Global Info Research) latest study, the global Permeable Cryoprotectant market size was valued at US\$ 71.5 million in 2024 and is forecast to a readjusted size of USD 93.3 million by 2031 with a CAGR of 3.8% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Osmotic cryoprotectants are a class of chemical substances with low molecular weight, high water solubility and membrane permeability. They can enter the cell through the cell membrane under low temperature conditions and reduce freezing damage through various mechanisms. Its core mechanisms of action include: 1) combining with water molecules in cells to form hydrogen bonds, reducing the proportion of freezable water in cells, thereby reducing ice crystal formation; 2) lowering the freezing point of the solution by increasing the concentration of solutes in cells, delaying the phase change process; 3) replacing bound water on the surface of biological macromolecules (such as proteins and lipid membranes) to maintain their natural conformation and functional integrity; 4) regulating intracellular osmotic pressure to alleviate cell shrinkage caused by freezing and dehydration. Typical representatives include glycerol, dimethyl sulfoxide (DMSO), ethylene glycol, etc., because they can directly act on key molecules in cells, they are irreplaceable in the preservation of biological samples such as germ cells, embryos and stem cells that are highly sensitive to freezing damage.
